# Lecture 13 - "Geodetic Reference Systems" 

GISC-3325
27 February 2012

## Updates

- Read Chapter 8 for this Wednesday and next Monday.
- Be sure to select your article for the oral (and written report). Must be from Journal of Geodesy or GPS Solutions (both available through campus computers).
- Good article on datum transformations at: http:// mycoordinates.org/choosing-the-best-path-global-to-national-coordinate-transformations/

## 3D Coordinate Systems

- Geodetic (Curvilinear) Coordinates
- Latitude, longitude and ellipsoid height
- Right-handed, earth-centered earth-fixed, positive east
- Geocentric (Cartesian) Coordinates
- X, Y, Z
- Likewise, ECEF, right-handed,
- Orthogonal

## GPS vectors

Difference in geocentric coordinates．

## Local Geodetic Horizon (LGH)

- ECEF, right-handed, orthogonal, 3-D
- Origin at any point specified
-N in meridian plane oriented toward N pole
- U normal to ellipsoid at origin
- E perpendicular to meridian plane
- Depending on software (or algorithm) values can appear as ENU or NEU.

## LGH

$$
\begin{aligned}
& e=r \cos (v \angle) \sin \alpha=r \sin (z \angle) \sin \alpha \\
& n=r \cos (v \angle) \cos \alpha=r \sin (z \angle) \cos \alpha \\
& u=r \sin (v \angle)=r \cos (z \angle) \\
& \alpha=\arctan \left(\frac{e}{n}\right) \quad \text { Geodetic azimuth. } \\
& r=\left(e^{2}+n^{2}+u^{2}\right)^{1 / 2} \text { Text } \quad \begin{array}{l}
\text { Mark-to-mark slant } \\
\text { range. }
\end{array} \\
& v \angle=\arcsin \left(\frac{u}{r}\right) \quad \text { Vertical or zenith angle } \\
& z \angle=\arccos \left(\frac{u}{r}\right) \quad
\end{aligned}
$$

Either vertical angle or zenith angles can be used.

## Geodetic to Geocentric Coordinate Conversions

The conversion from curvilinear geodetic $(\lambda, \phi, h)$ to Cartesian $(x, y, z)$ coordinates is given by the well-known equations:

$$
\left\{\begin{array}{l}
x  \tag{3}\\
y \\
z
\end{array}\right\}=\left\{\begin{array}{c}
(N+h) \cos \phi \cos \lambda \\
(N+h) \cos \phi \sin \lambda \\
{\left[N\left(1-e^{2}\right)+h\right] \sin \phi}
\end{array}\right\}
$$

$$
\begin{aligned}
& N=\frac{a \cos \phi}{\cos \phi\left(1-e^{2} \sin ^{2} \phi\right)^{1 / 2}}, \\
& \therefore \quad N=\frac{a}{\left(1-e^{2} \sin ^{2} \phi\right)^{1 / 2}}
\end{aligned}
$$

## Geocentric to Geodetic

$$
\begin{aligned}
& \left(\lambda, \phi, h_{e}\right)_{a, f}=g(x, y, z) \\
& h_{e}=\frac{\sqrt{x^{2}+y^{2}}}{\cos \phi}-N \\
& \phi=\arctan \left\{\frac{\mathrm{z}}{\sqrt{\mathrm{x}^{2}+\mathrm{y}^{2}}}\left[1-\mathrm{e}^{2}\left(\frac{\mathrm{~N}}{\mathrm{~N}+\mathrm{h}_{\mathrm{e}}}\right)\right]^{-1}\right\} \\
& \lambda=\arctan \left(\frac{y}{x}\right) \\
& N=\frac{a}{\left(1-e^{2} \sin ^{2} \phi\right)^{1 / 2}} .
\end{aligned}
$$

## Geocentric to Geodetic

- We use ellipsoid parameters (a, f-1 $)$
- Calculate preliminary values (set: $\mathrm{h}=0$ )
- Lat $_{1}=\operatorname{atan}\left(\left(Z / \operatorname{sqrt}\left(x^{2}+y^{2}\right)\right)^{*}\left(1 /\left(1-e^{2}\right)\right)\right.$
$-N_{1}=a / \operatorname{sqrt}\left(1-e^{2 *} \sin \left(L^{2} t_{1}\right)^{2}\right)$
$-h_{1}=\left(\operatorname{sqrt}\left(x^{2}+y^{2}\right) / \cos \left(\right.\right.$ Lat $\left.\left._{1}\right)\right)-\mathrm{N}_{1}$
- We iterate using these starting values
- We stop iterating when the shift in ellipsoid height is within our accuracy goal.

## 2D-Coordinate Transformations

- Given
$-x=r * \cos (y)$
$-y=r * \sin (y)$
- Rotate coordinate system by $\Theta$
$-x^{\prime}=r^{*} \cos (\gamma-\Theta)$
$-y^{\prime}=r^{*} \sin (\gamma-\Theta)$
- Use following trig identities to solve:
$-\cos (\gamma-\Theta)=\cos \gamma \cos \Theta+\sin \Theta \sin \gamma$
$-\sin (\gamma-\Theta)=\sin \gamma \cos \Theta-\cos \gamma \sin \Theta$

## Translation

- If we shift the origin we can update coordinates by merely adding/subtracting shift from matching coordinate.
$-x^{\prime}=x-t x$
$-y^{\prime}=y-t y$

## Scale change

- We can scale coordinates to account for issues like m to ft .

$$
\begin{aligned}
& -x^{\prime}=s^{*} x \\
& -y^{\prime}=s^{*} y
\end{aligned}
$$

## Four-parameter transformation

- Combines rotations, translations and scale in one operation. Two-dimension case.
$-x^{\prime}=s^{*}\left(x^{*} \cos \Theta+y^{*} \sin \Theta\right)+t x$
$-y^{\prime}=s^{*}\left(-x^{*} \sin \Theta+y^{*} \cos \Theta\right)+t y$
- Matrix form is simpler

## Three-Dimensional Transformation

- 7-parameters
- one scale
- three rotations along $X, Y, Z$ axes
- three translations in $X, Y, Z$

## Euler matrices and 7-parameter

$$
\begin{aligned}
& \mathrm{D} \equiv\left[\begin{array}{ccc}
\cos \phi & \sin \phi & 0 \\
-\sin \phi & \cos \phi & 0 \\
0 & 0 & 1
\end{array}\right] \\
& \mathbf{C} \equiv\left[\begin{array}{ccc}
\cos \theta & 0 & -\sin \theta \\
0 & 1 & 0 \\
\sin \theta & 0 & \cos \theta
\end{array}\right] \\
& \mathbf{B} \equiv\left[\begin{array}{ccc}
1 & 0 & 0 \\
0 & \cos \psi & \sin \psi \\
0 & -\sin \psi & \cos \psi
\end{array}\right]
\end{aligned}
$$

Matrix $D$ for rotation on $Z$ axis
Matrix C for rotation of Y axis
Matrix B for rotation of $X$ axis

$$
\left(\begin{array}{l}
x \\
y \\
z
\end{array}\right)_{S}=\left(\begin{array}{l}
\Delta x \\
\Delta y \\
\Delta z
\end{array}\right)+(1+\Delta L)\left(\begin{array}{ccc}
1 & \omega_{3} & -\omega_{2} \\
-\omega_{3} & 1 & \omega_{1} \\
\omega_{2} & -\omega_{1} & 1
\end{array}\right)\left(\begin{array}{l}
x \\
y \\
z
\end{array}\right)_{D}
$$

## Euler matrices

In $\mathbb{R}^{3}$, coordinate system rotations of the $x$-, $y$-, and $z$-axes in a counterclockwise direction when looking towards the origin give the matrices

$$
\begin{align*}
& \mathrm{R}_{x}(\alpha)=\left[\begin{array}{ccc}
1 & 0 & 0 \\
0 & \cos \alpha & \sin \alpha \\
0 & -\sin \alpha & \cos \alpha
\end{array}\right]  \tag{4}\\
& \mathrm{R}_{y}(\beta)=\left[\begin{array}{ccc}
\cos \beta & 0 & -\sin \beta \\
0 & 1 & 0 \\
\sin \beta & 0 & \cos \beta
\end{array}\right]  \tag{5}\\
& \mathrm{R}_{z}(\gamma)=\left[\begin{array}{ccc}
\cos \gamma & \sin \gamma & 0 \\
-\sin \gamma & \cos \gamma & 0 \\
0 & 0 & 1
\end{array}\right] \tag{6}
\end{align*}
$$

## 7-parameters to transform NAD83 to ITRF96

| $T_{X}(t)=0.9910 \mathrm{~m}$ | $(5)$ |
| :---: | :---: | :---: |
| $T_{y}(t)=-1.9072 \mathrm{~m}$ | $(6)$ |
| $T_{Z}(t)=-0.5129 \mathrm{~m}$ | $(7)$ |
| $R_{X}(t)=[125033+258(t-1997.0)]\left(10^{-12}\right)$ radians | $(8)$ |
| $R_{y}(t)=[46785-3599(t-1997.0)]\left(10^{-12}\right)$ radians | $(9)$ |
| $R_{Z}(t)=[56599-153(t-1997.0)]\left(10^{-12}\right)$ radians $(10)$ |  |
| $S(t)=0.0($ unitless $)$ | $(11)$ |
| When transforming from NAD 83 to ITRF96, |  |

Table 1. Transformation Parameters between Different Frames for $t_{0}=1997.00$

| Parameter | Units | ITRF00 $\rightarrow$ ITRF97 | ITRF97 $\rightarrow$ ITRF96 | ITRF96 $\rightarrow$ NAD 83 |
| :--- | :---: | :---: | :---: | :---: |
| $T_{x}\left(t_{0}\right)$ | meters | +0.0067 | -0.00207 | +0.9910 |
| $\dot{T}_{x}$ | meters/year | +0.0000 | +0.00069 | $+0.0^{\mathrm{a}}$ |
| $T_{y}\left(t_{0}\right)$ | meters | +0.0061 | -0.00021 | -1.9072 |
| $\dot{T}_{y}$ | meters/year | -0.0006 | -0.00010 | $+0.0^{\mathrm{a}}$ |
| $T_{z}\left(t_{0}\right)$ | meters | -0.0185 | -0.00995 | -0.5129 |
| $\dot{T}_{z}$ | meters/year | -0.0014 | +0.00186 | $+0.0^{\mathrm{a}}$ |
| $\varepsilon_{x}\left(t_{0}\right)$ | mas | $+0.0^{\mathrm{a}}$ | +0.12467 | +25.79 |
| $\dot{\varepsilon}_{x}$ | mas/year | $+0.0^{\mathrm{a}}$ | +0.01347 | +0.0532 |
| $\varepsilon_{y}\left(t_{0}\right)$ | mas | $+0.0^{\mathrm{a}}$ | -0.22355 | +9.65 |
| $\dot{\varepsilon}_{y}$ | mas/year | $+0.0^{\mathrm{a}}$ | -0.01514 | -0.7423 |
| $\boldsymbol{\varepsilon}_{z^{2}}\left(t_{0}\right)$ | mas | $+0.0^{\mathrm{a}}$ | -0.06065 | +11.66 |
| $\dot{\varepsilon}_{z}$ | mas/year | -0.02 | +0.00027 | -0.0316 |
| $s\left(t_{0}\right)$ | ppb | +1.55 | -0.93496 | $+0.0^{\mathrm{a}}$ |
| $\dot{s}$ | ppb/year | +0.01 | -0.19201 | $+0.0^{\mathrm{a}}$ |

Note: mas $\equiv$ milliarc second. Counterclockwise rotations of axes are assumed positive; $1 \mathrm{ppb}=10^{-3} \mathrm{ppm}$.
${ }^{\text {a }}$ Values set to zero by definition.

Table 2. Parameters Adopted for Transformation ITRF00 $\rightarrow$ NAD 83 (CORS96)

Parameter epoch:

| $t_{0}=1997.00$ | Definition | Units | Values at $t_{0}$ |
| :--- | :---: | :---: | :---: |
| $T_{x}\left(t_{0}\right)$ | $x$-shift | meters | +0.9956 |
| $T_{y}\left(t_{0}\right)$ | $y$-shift | meters | -1.9013 |
| $T_{z}\left(t_{0}\right)$ | $z$-shift | meters | -0.5215 |
| $\varepsilon_{x}\left(t_{0}\right)$ | $x$-rotation | mas | +25.915 |
| $\varepsilon_{y}\left(t_{0}\right)$ | $y$-rotation | mas | +9.426 |
| $\varepsilon_{z}\left(t_{0}\right)$ | $z$-rotation | mas | +11.599 |
| $s\left(t_{0}\right)$ | scale | ppb | +0.62 |
| $\dot{T}_{x}$ | $x$-shift rate | meters/year | +0.0007 |
| $\dot{T}_{y}$ | $y$-shift rate | meters/year | -0.0007 |
| $\dot{T}_{z}$ | $z$-shift rate | meters/year | +0.0005 |
| $\dot{\varepsilon}_{x}$ | $x$-rotation rate | mas/year | +0.067 |
| $\dot{\varepsilon}_{y}$ | $y$-rotation rate | mas/year | -0.757 |
| $\dot{\varepsilon}_{z}$ | $z$-rotation rate | mas/year | -0.051 |
| $\dot{s}$ | scale rate | ppb/year | -0.18 |

Note: mas $\equiv$ milliarc second. Counterclockwise rotation of axes are assumed positive; $1 \mathrm{ppb}=10^{-3} \mathrm{ppm}$.
